

Dry Heat Sterilizers

Why dry heat sterilizers instead of an autoclave? No water needed. Less space required. No pit in the floor. No building fortification. Assembled inside your building and not outside your building. Lower initial costs. Lower costs for maintenance. Downtime renovation and installation!

Gruenberg's Steri-Dry™ sterilizers use dry heat instead of steam to sterilize laboratory animal cages and other lab equipment in research and laboratory settings. Not only is dry heat sterilization most effective, but it is lower in both costs and energy consumption. Gruenberg's wide variety of dry heat Steri-Dry™ sterilizers are available in multiple sizes, modular, panelized and temperature ranges.
